

What Can a User Do on LifeLink?

A Plain-English, Comprehensive Walkthrough of Every Screen, Feature, and User Flow

Target Audience: Patients, Family Attendants, Voluntary Donors, Hospital Staff, Lab Technicians, Evaluators

Focus: User Experience, Screen Actions, Visual Controls, and Interactive Workflows (No Code / No Backend Jargon)

Document Date: September 16, 2026

What is LifeLink at a glance?

LifeLink is a centralized emergency website that replaces frantic phone calls and chaotic WhatsApp messages during medical crises. Whether you are a desperate family member seeking rare blood for a patient, a healthy citizen wanting to donate blood, an ER doctor monitoring local trauma cases, or a citizen needing an urgent ambulance—this single website connects everyone in real time on an interactive city map.

Summary of User Personas & What They Can Do:

User Persona	Immediate Need / Role	What They Do On This Website
Patient Attendant	Needs blood or emergency resource fast	Fills the 1-minute Emergency Request form; tracks progress live from 'Matching' to 'Confirmed'; gets direct phone & GPS directions.
Voluntary Donor	Wants to help without spam calls	Toggles availability 'ON/OFF'; sets travel radius (e.g. 10 km); accepts live emergency dispatches while keeping personal phone number hidden.
Hospital Doctor / ER	Triage & emergency coordination	Monitors active critical trauma cases across the city; requests emergency blood or life-support ambulances for arriving patients.
Blood Bank Technician	Managing daily inventory	Updates live units for Packed RBC, Platelets, Plasma, and Whole Blood across 8 blood groups with 1-click '+' and '-' buttons.
General Public	Needs emergency logistics	Searches 24x7 stocked pharmacies for rare coagulants/drugs; dispatches nearby Basic/Advanced Life Support ambulances; dials SOS 108.

1. The Homepage — The Emergency Hub

When any visitor opens the website, they are greeted by a distraction-free, high-contrast emergency screen designed for quick decisions under stress.

Key Elements on the Homepage:

- **Two Giant Call-to-Action Buttons:**

- **'I NEED HELP' (Red Button):** Clicked by family members or attendants in emergency. Takes you straight to the blood & resource request form.

- **'I CAN HELP' (Green Button):** Clicked by registered or new voluntary donors ready to donate blood in their neighborhood.

- **Live Emergency Ticker:** Displays real-time critical requests currently pending in the city (e.g., *'Patient Rahul Sharma: 2 units O+ Packed RBC needed at AIIMS'*). Visitors can click any card to see its live coordination status.

- **One-Click Resource Directory:** Quick visual shortcut cards for **Blood Banks** (4 verified), **Hospitals** (Apex centers), **Ambulances** (on-duty fleet), **Pharmacies** (24x7 stocked), **Volunteers**, and the **Radar Map**.

- **SOS 108 Hotline Button:** Always visible in the top header for immediate telephone connection to government emergency services.

2. Creating an Emergency Request ('I Need Help')

When a user clicks **'I NEED HELP'**, they are taken to a streamlined form that collects only vital medical and location details:

- **Step 1: Patient Information:** Enter patient's name, choose their exact Blood Group (O+, O-, A+, A-, B+, B-, AB+, AB-), pick the specific Component required (Packed RBC, Platelets, Plasma, Whole Blood), and state the number of units required (e.g., 2 units).

- **Step 2: Hospital Selection:** Select the medical facility (e.g., AIIMS Hospital, Capital Hospital, Apollo, KIMS). The system automatically maps the GPS coordinates of that facility.

- **Step 3: Urgency Level & Deadline:** Select between *Normal* (within 24 hrs), *Urgent* (6-12 hrs), or *Critical* (immediate, under 2 hrs). Enter the deadline in hours and an attendant's phone number for receiving delivery.

- **Step 4: Click 'Create Emergency Request':** The moment you click submit, the website generates a unique tracking code (like #LL-2841) and instantly notifies nearby blood banks and eligible volunteers.

3. The Live Request Tracker — The Requester's Cockpit

Once the request is submitted, the user is redirected to a live interactive coordination dashboard. Here is what they see and can do:

A. The 5-Stage Live Progress Stepper:

An animated progress bar visually moves through 5 stages as emergency actions take place:

1. **Matching:** The system scans all blood banks and voluntary donors in the city.

2. **Blood Bank Contacted:** Alerts sent to verified blood centres with stock.

3. **Volunteer Response:** A nearby donor accepts the dispatch.

4. **Resource Confirmed:** Units reserved and in transit to the hospital.

5. **Completed:** Transfusion delivered and patient secured.

B. Ranked Resource Cards (The Best Matches First):

The website displays a prioritized list of available options sorted by match quality:

- **Match Score %:** e.g., *AIIMS Blood Center — 99% Match* (closest, stock verified) vs *Capital Hospital — 94.7% Match*.
- **Distance:** Tells the user exactly how far away the resource is (e.g., *4.2 km away*).
- **Direct Action Buttons on Every Card:**
 - **[CALL] Button:** One tap dials the blood bank or opens a secure masked call to the volunteer.
 - **[DIRECTIONS] Button:** Opens Google Maps with turn-by-turn driving directions straight to that blood bank.

4. The Emergency Radar Map — City-Wide Geo Navigation

LifeLink includes a full-screen interactive satellite and street map powered by OpenStreetMap and Leaflet:

What Can the User Do on the Map?

- **See Color-Coded Pins:**
 - ■ **Red Pins:** Verified Blood Banks with stock summary.
 - ■ **Indigo Pins:** Apex Hospitals with ICU bed counts.
 - ■ **Amber Pins:** Ambulances (shows if Available or on a trip).
 - ♥■ **Emerald Pins:** Registered Voluntary Donors ready to help.
 - ■ **Pulsing Red Marker:** The exact hospital where the patient is waiting.
- **Click Any Marker for a Popup Card:** Shows institution name, exact street address, phone number, operating hours (e.g. 24x7), and a 'Get Directions' shortcut.
- **Filter by Resource:** Want to see only Ambulances? Or only Blood Banks? Simply click the filter buttons at the top of the map.
- **Filter by Blood Group:** Select 'O-' from the map filter, and the map will highlight only centers and donors carrying O-blood.

5. The Volunteer Portal ('I Can Help') — Privacy-First Giving

Many willing donors avoid registering on blood websites because they fear spam calls or privacy leaks. LifeLink solves this with a privacy-first volunteer interface:

Volunteer User Features:

- **Anonymous Display Names:** Donors use handles like *Rohan_M* or *Ananya_K*. Their real phone numbers and email addresses are NEVER displayed publicly on the website.
- **Emergency Availability Switch:** A simple toggle switch. If you are sick, working, or out of town, toggle it OFF. You will not receive emergency alerts until you turn it back ON.
- **Dispatch Radius Slider:** Drag a slider from 2 km to 30 km. You only get alerts for patients within your chosen travel comfort zone.
- **Incoming Emergency Alert Queue:** When a compatible patient nearby needs blood, a red emergency card appears on your screen showing patient name, hospital, and units needed.
- **[ACCEPT DISPATCH] / [DECLINE] Buttons:**
 - Clicking **Accept** notifies the requester instantly that a donor is on the way and generates a secure bridge token.
 - Clicking **Decline** dismisses the card gracefully without penalty.

6. Hospital & Blood Bank Dashboards — Staff Views

A. Hospital Triage Portal:

Designed for ER doctors and medical coordinators:

- **Live Triage Counters:** Shows Active Requests, Critical Trauma Cases, Blood Requests, and Available Ambulances at a glance.
- **Today's Throughput Stats:** Total requests received, successfully resolved, and currently pending.
- **Live Triage Feed:** ER staff can click any incoming patient to monitor the status of their blood unit in transit.

B. Blood Bank Inventory Hub:

Designed for certified blood bank technicians (aligned with national e-RaktKosh standards):

- **Multi-Component Tabs:** Switch between **Packed RBC, Platelets, Plasma, and Whole Blood**.
- **8 Blood Group Tiles:** Displays current units for O+, O-, A+, A-, B+, B-, AB+, AB-.
- **1-Click Stock Updates:** Technicians click **[+]** when blood is collected and **[-]** when blood is issued. The updated stock updates across the entire city instantly without reloading.

7. Ambulance Fleet & 24x7 Pharmacy Modules

A. Ambulance Dispatch Directory:

Allows users facing trauma or transit emergencies to locate nearby emergency vehicles:

- **Vehicle Details:** Shows vehicle number (e.g. *OD-02-AX-1081*), verified driver name, and base location.
- **Type Distinction:** Differentiates between *Advanced Life Support (ALS)* (for ventilators/cardiac emergencies) and *Basic Life Support (BLS)*.
- **[REQUEST DISPATCH] Button:** Sends a dispatch signal and triggers GPS tracking.
- **[Secure Driver Call] Button:** One-click telephone dial to the on-duty driver.

B. Emergency Pharmacy & Medication Network:

In critical surgeries, specific coagulants and medications (like Heparin, Tranexamic Acid, Albumin, IV Saline) are as urgent as blood:

- **Search Bar:** Type any drug name to filter pharmacies that recently reported it in stock.
- **24x7 Operating Badge:** Clearly tags round-the-clock facilities vs day-shift pharmacies.
- **Telemetry Freshness Timestamp:** Shows '*Reported 8 mins ago*' so users know how fresh the data is, avoiding wasted travel.
- **Direct Call Shortcut:** Lets users confirm with the pharmacist with one tap before driving.

8. Complete Step-by-Step User Journey

Phase	User Action	What Happens on Screen
1. Distress	Family arrives at AIIMS ER; doctor requests 2 units O+ Packed RBC.	Attendant opens LifeLink on mobile phone and taps red 'I NEED HELP' button.
2. Submission	Selects 'O+', 'Packed RBC', '2 Units', 'AIIMS', urgency 'Critical'.	Taps 'Create Emergency Request'. Request #LL-2841 is created instantly.
3. Matching	User looks at Request Tracker screen.	Matching Engine displays AIIMS Blood Bank (99% match, 0 km) and Capital Hospital (94.7% match, 5.9 km) with [CALL] & [DIRECTIONS].
4. Alert	Eligible volunteer Rohan_M opens the Volunteer Portal.	A red emergency dispatch card pops up on his screen. He reviews it and clicks 'ACCEPT DISPATCH'.
5. Live Update	Attendant looks at their phone screen.	Progress stepper automatically transitions from 'Matching' to 'Volunteer Response' live without refreshing.
6. Resolution	Blood is delivered to ICU-2 and verified by doctors.	Status marks 'Completed'. The entire emergency was coordinated in minutes.

Summary: LifeLink empowers everyday citizens, emergency coordinators, and healthcare professionals with clarity, speed, and privacy when seconds matter most.
